

Streamlining IT Procurement

Automating Standard Laptop Orders with Flow Designer

Project Title: Streamlining IT Procurement

Solution: Standard Laptop Procurement Automation

Platform: ServiceNow

Automation Tool: Flow Designer

Activity 1: Create a Flow to Create Catalog Task After Approval

Story Duration: 40m

I created a Flow Designer flow to automatically create a Catalog Task for an approved Standard Laptop request and assign the task to the Hardware team.

1. I opened ServiceNow.
2. I clicked **All** and searched for **Flow Designer**.
3. I selected **Flow Designer** under **Process Automation**.
4. I clicked **New** and selected **Flow**.
5. Under Flow properties, I entered the Flow Name as **Standard laptop task**.
6. I kept the Application as **Global**.
7. I selected **System user** as the Run user.
8. I clicked **Submit**.
9. I clicked **Add a trigger**.
10. I searched for and selected **Service Catalog**, then clicked **Done**.
11. Under Actions, I clicked **Add an action**.
12. I searched for and selected **Create Catalog Task**.
13. I selected the **Requested Item Record** in the Request item field.
14. The table was automatically populated as **Catalog Task**.
15. I entered the Short description as **Laptop need to Configured**.
16. I added the Description field with the value **Laptop need to Configured**.
17. I selected the Assignment group as **Hardware**.
18. I selected the Approval field as **Approved**.
19. I left the remaining fields as default and clicked **Done**.
20. I clicked **Save** and then **Activate** to activate the flow.

Activity 2: Assign the Flow to the Standard Laptop Service Catalog

Story Duration: 11h 40m

I connected the newly created **Standard Laptop Task** flow to the Standard Laptop service catalog item so that the automation is used for that request.

1. I opened ServiceNow.
2. I clicked **All** and searched for **Maintain Items**.
3. I selected **Maintain Items**.
4. Under the Name field, I searched for **Standard Laptop** and selected the record.
5. Under that record, I opened **Process engine**.
6. I removed the remaining automations.
7. I added the flow created in Activity 1 with the name **Standard Laptop Task**.
8. I used the menu option to save the record.

Configuration Result

The Standard Laptop catalog item was configured to use the created Flow Designer automation. This connects the service request to the automated Catalog Task creation process.

Activity 3: Place a Standard Laptop Order and Verify the Approval Workflow

Story Duration: 20m

I tested the complete workflow by placing a Standard Laptop request, approving it, and checking the resulting Catalog Task.

1. I clicked **All** and searched for **Service Catalog**.
2. I opened **Service Catalog** and selected **Hardware**.
3. I scrolled to find **Standard Laptop** and opened it.
4. I clicked **Order Now** to place the request.
5. I checked the **Order status** and opened the **Request Number**.
6. I opened the Requested Item record and scrolled to the **Approvers** section.
7. I right-clicked the approver record, opened the configuration option, and selected **Approve**.
8. I opened the **Requested Item** section again.
9. I opened the **Catalog Tasks** section.
10. I opened the Catalog Task record to verify the updated status, Short description, and Assignment group.

Expected Verification

Item	Configured / Verified Value
Flow	Standard laptop task
Request Item	Requested Item Record
Catalog Task	Created automatically after approval
Short Description	Laptop need to Configured
Description	Laptop need to Configured
Assignment Group	Hardware
Approval	Approved

Overall Outcome

The Standard Laptop procurement flow was configured and connected to the Standard Laptop service catalog item. During testing, the request was placed through the Service Catalog, the approval was completed, and the resulting Catalog Task was checked for its status, Short description, and Assignment group. The process is intended to reduce manual task creation, improve visibility, and support consistent laptop configuration processing by the Hardware team.
